The **Gold** Standard for Rework

---

### *DL Series de-lidder™*

This Midas Technology-trademarked system is designed to remove lids from hermetic microelectronic packages, so successful that after 25 years, the term de-lidder™ has become industry standard.

It mills through lid flanges so precisely that packages can be resealed without further processing. It is clean-room friendly, so packages in rework cycles never leave controlled atmosphere.

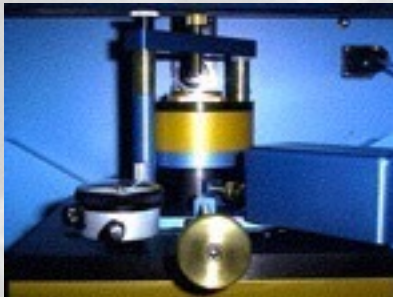

For over 30 years our de-lidder™ machines have been the industry's state of the art solution for removing lids from hermetic packages. Our systems are designed for cleanroom use, by cleanroom staff - not skilled machinists. Our process uses special high-speed tooling, set up to machine through lid flanges from below. Particles are kept out of the package cavity by tool and lid geometry, gravity, and vacuum.
